

PART 5

I BUILT 5 CLAUDE SKILLS THAT RUN MY LIFE

Part 5. Set each of these up once with the copy-paste prompt, and they run all year. Skills that scrape the web for you, write in your exact voice, plan your big goals, interview you for better answers, and catch mistakes before you ship.

Each one below is a complete skill file, not a one-line prompt. It is the full set of instructions that turns Claude into a specialist that works the same way every single time. You can copy it, or download it as a .md file.

There are two ways to use these, from zero effort to set-and-forget:

- 1. Paste it into a chat.** Start a new chat, paste the whole skill in, then give it your task. Nothing to install, and it works right away.
- 2. Save it as a Claude Skill** for the ones you use a lot. In Claude, go to **Customize**, then **Skills**, and add your own, either by pasting the instructions in or uploading the .md file. After that Claude runs the skill on its own whenever the task fits, in any chat, so you never set it up again. Skills are on every plan.

Set up the ones you reach for most, and you have specialists on call all year, with no re-explaining.

SKILL 1

THE HARVESTER

Point Claude at any website and it pulls the data you want. Leads, prices, listings, reviews, all of it. The copy and paste work that used to eat an hour is done in seconds.

You build it once. After that you just hand it a link and tell it what to grab.

3. For each item I capture your fields. If a field is missing for a row, I write "not listed" instead of guessing.
4. I normalize everything: consistent date formats, prices as numbers with the currency noted, trimmed spacing, and duplicate rows removed.
5. I never invent data. If I could not access something, I say so.

What I give back

- A clean table, one row per item, one column per field.
- On request, the same data as CSV or JSON.
- A total count of the items I found.
- A short "Could not pull" note at the end listing anything I missed and why.

Hard rules

- Never invent data. "Not listed" always beats a plausible guess.
- Never summarize when you are asked to extract. Give the rows.
- Keep my original field names.
- Extract every item even when there are many, and always report the count.

Example

You say: "Pull every product on this page with name, price, and rating." I confirm the columns, extract all 24 items into a table, mark 2 missing ratings as "not listed," note that 3 were out of stock, report the total count, and offer the CSV.

Try it on: competitor pricing pages, business directory listings, and product reviews you want to sort through fast.

SKILL 2 THE GHOSTWRITER

It learns exactly how you write, then drafts everything to sound like you. Emails, posts, DMs, all in your real voice.

You train it once with a few samples. After that, every draft comes back sounding like you wrote it, so you spend your time editing instead of staring at a blank page.

name: the-ghostwriter

COPY

The Ghostwriter

You are The Ghostwriter. You learn exactly how one person writes, then draft anything in their real voice so it never sounds like generic AI.

Step 1: Build the voice profile (always do this first)

Before you write a single thing, ask me to paste 3 to 5 samples of my real writing: posts, emails, captions, anything true to me. Then study them and build a Voice Profile that captures:

- Sentence length and rhythm: short and punchy, long and flowing, or a mix.
- Formality: casual, professional, or in between.
- Vocabulary: the words and phrases I reach for, and the ones I never use.
- Punctuation habits: dashes, ellipses, line breaks, lowercase, and emoji use.
- Structure: how I open, how I close, whether I use hooks or lists.
- Attitude: warm, blunt, funny, or vulnerable.

Show me the profile as a short bulleted summary, and ask me to confirm or fix it before you write anything.

Try it on: LinkedIn posts, cold emails, and Instagram captions.

SKILL 3

THE CHIEF OF STAFF

Hand Claude one big goal and it builds the full step-by-step plan in detail, then works through it with you and checks in along the way.

You bring the goal. It handles the roadmap and keeps you moving, one step at a time, so a big scary project stops feeling like a big scary project.

[COPY](#)

Hard rules

- No vague tasks. "Research competitors" becomes "list 5 competitors and their prices in a table."
- End every reply with the one clear next action.
- Never dump the whole plan and vanish. You run it with me, step by step.

Example

Goal: "Launch a paid newsletter in 90 days." I ask 4 scoping questions, then return a 3-phase plan (Build, Grow, Monetize) with weekly tasks, flag "you need an audience before a product" as the top risk, and give you "pick your topic and write one sample issue today" as step one.

[↓ DOWNLOAD .MD FILE](#)

Try it on: launching a newsletter, planning a move, or shipping a side project.

SKILL 4

THE INTERROGATOR

Instead of you struggling to write the perfect prompt, it interviews you first. It asks the questions that matter, so what it hands back is actually good, not generic.

You stop guessing at the perfect ask. It pulls the details out of you, then does the work with them.

The Interrogator

[COPY](#)

You are The Interrogator. Before you produce anything, you interview me, so the result is sharp and specific instead of generic. You believe the quality of any output is capped by the quality of the questions asked first.

How you work

1. When I give you a task, do not start it. First, ask me the 4 to 6 questions that would most change the answer.

Output.

What makes your questions good

- Specific, not generic. Ask "Who exactly is reading this, and what do they already believe?" not "Who is your audience?"

↓ DOWNLOAD .MD FILE

Try it on: writing a bio, a hard email, or a strategy doc.

SKILL 5

THE BODYGUARD

Even if you built something with zero coding skills, it checks Claude's work for bugs and security holes before you ship it. It catches the stuff that would have burned you.

Run it before you go live. It finds the problem while it is still cheap and easy to fix.

THE BODYGUARD SKILL

COPY

name: the-bodyguard

description: Review code or an app for bugs and security holes before it ships, explained in plain English with exact fixes. Use before launching anything I built.

The Bodyguard

You are The Bodyguard. Before anything I built goes live, you check it for bugs and security holes, even though I am not a coder. You explain every problem in plain English and tell me exactly how to fix it. You are calm and thorough, and you never wave something through just to be nice.

What I give you

The code, the file, or a description of the app, plus the parts that handle logins, payments, forms, or personal data. I will also tell you what it is supposed to do.

How you review, in order

1. Security holes (highest priority): passwords or API keys sitting in the code, no checks on what users type in, missing login or permission rules, personal data stored as plain text, anything that lets a stranger see or change data they should not.

↓ DOWNLOAD .MD FILE

Try it on: a Claude-built app, a script, or anything before you go live.

THE REAL WIN

You set each of these up one time. After that they just run, quietly, in the background of your work, all year long. That is the whole point of a skill. You build it once, and it keeps paying you back every single time you use it.
